

Basic Linux Commands

Command	Example of usage	Description
ls	ls -la	List files and directories with detailed permissions.
cd	cd /C:/directory/path	Navigates to target dire
pwd	Pwd	Prints the current directory you are in.
mkdir	mkdir name_of_directory	Creates a new directory/folder.
rm	rm -rf directory	Removes files or directories.
cp	cp ed.txt de.txt	Copies a file or folder to a new destination.
mv	mv bse.txt nwbse.txt	moves or renames files/folders.
cat	cat text.txt	Displays full file contents in terminal.
grep	grep "him" tenz.txt	Searches for a specific string pattern inside file.
chmod	chmod 755 run.sh	updates file read, write and execute permissions.

Basic Linux Commands

Command	Options/Flags	Sample Usage	Description
git init	--initial-branch	git innit -b main	Starts a new, empty Git project in your folder.
git clone	--depth 1	git clone <url>	Downloads an existing repository from github to your device.
git status	-s	git status -s	Shows files changed, added, or deleted since last save.
git add	. (all files)	git add exmpl.html	Puts changed files in line (staging) to prepare for saving.
git commit	-m "message"	git commit -m "desc"	Saves staged files permanently into project history.
git log	--oneline	git log --oneline	Shows a list of all past saved snapshots (commit).
git diff	--staged	git diff --staged	Shows line-by-line code changes before you save.
git branch	-d <name>	git branch add-features	List, creates, or deletes, separate work branches.
git switch	-c <name>	git switch -c feat	Switches your project work to a different branch.
git merge	--no-ff	git merge new-feature	Combines work from another branch into your current one.
git restore	--staged	git restore --staged f.txt	Unselects files or cancels mistakes made in code.
git tag	-a / -m	git tag -a v1.2.9 -m "bug-fixes"	Labels a special save point with a version (e.g. v1.2.9).

The Three-tree Architecture of Git

[1. Working Directory] --- git add ---> [2. Staging Area] --- git commit ---> [3. Repository]

1. Working Directory

- Your work area. The actual folder on your computer where you write code. Changes here are live but not tracked yet.

2. Staging Area

-The waiting area. A draft holding area, running "git add" moves files here until ready to be committed.

3. Repository

- The vault. Permanent storage/database storing commit history.
